

Snow Shield™

WHITE ICE MELT

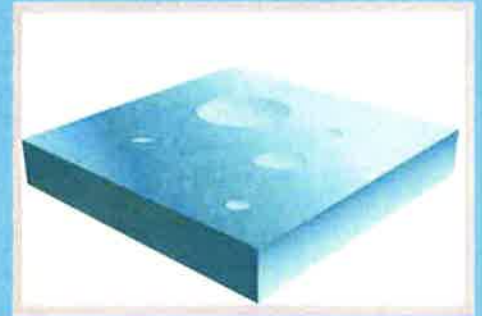

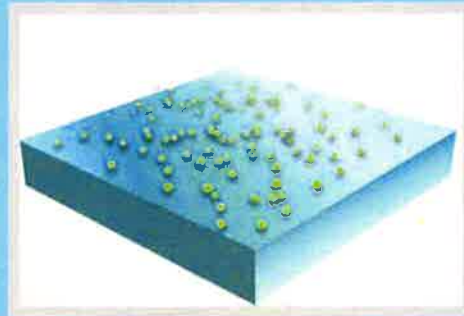

Snow Shield™ White Ice Melt is a proprietary formulation of Calcium Chloride, Magnesium Chloride, and Sodium Chloride.

Snow Shield White is proven to work at lower temperatures while working to preserve vegetation.

Because Snow Shield™ White Ice Melt is a blend that melts more effectively than most other products, less is needed to get the job done, meaning less of an environmental impact.

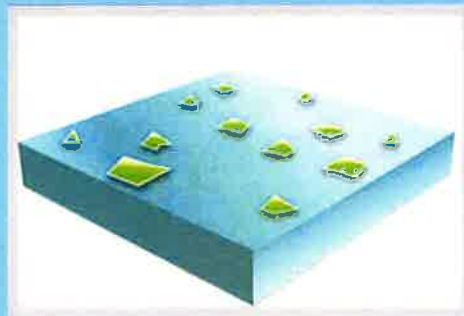

This product contains no dyes or pigments eliminating any stain that may remain in the residual material.

Snow Shield™ White Ice Melt is granulated to optimize melting power, so there is less wasted material and no wasted time.

Granules that are too small won't penetrate ice.

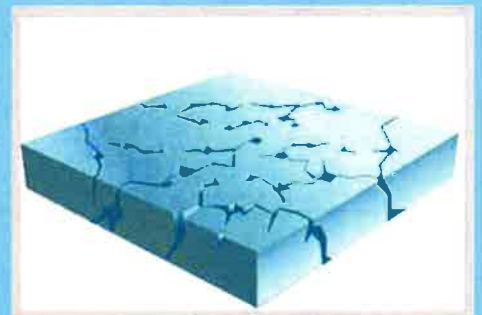

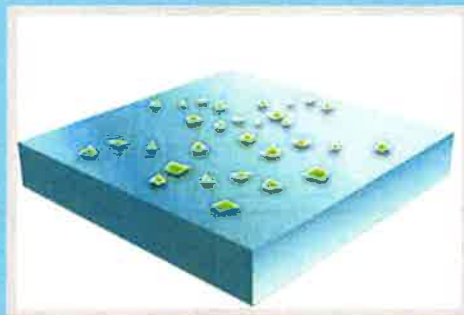

Granules that are too small will start melting quickly, but won't penetrate the ice layer to break it apart.

Granules that are too large won't dissolve properly.

Large granules will often penetrate the ice layer, but won't dissolve efficiently to create a brine layer.

The consistent, medium-sized granules that are used in Snow Shield™ White Ice Melt penetrate the ice surface and maximize ice separation, making the removal process as easy as possible.

Snow Shield™ White Ice Melt's consistent granules optimize melting ability.
