

MELTMORE

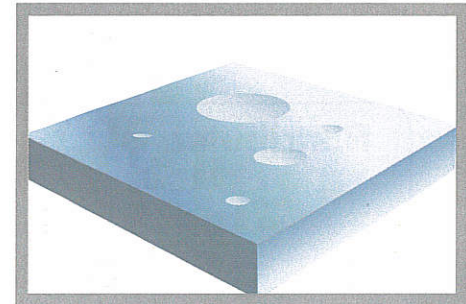

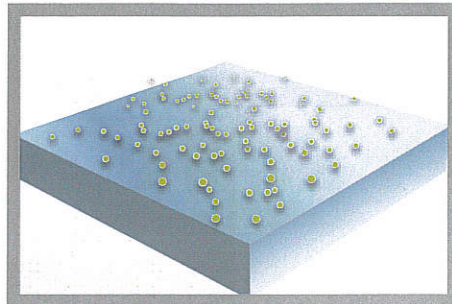

ORGANIC DEICER

MELTMORE Organic Deicer is a proprietary formulation consisting of Sodium Chloride Crystals treated with a mixture of Calcium Chloride blended with an Organic Based Performance Enhancer. MELTMORE Organic Deicer is a proven Earth Friendly formula using anti icing chemicals to create an Earth, Kid and Pet Friendly product which is safer for concrete, brick pavers and landscaping. MELTMORE Organic Deicer greatly reduces corrosion of metals (both structural and equipment) common when using straight Rock Salt or Calcium Chloride.

Because MELTMORE Organic Deicer is a blend containing Sodium Chloride Crystals treated with a mixture of Calcium Chloride and Agricultural Based Corrosion Inhibitors it melts more effectively than most other products. MELTMORE is effective down to -20°F surface temperature and will leave a residual that will greatly reduce application rates. This means less product used to get the job done and less of an environmental impact.

Meltmore is granulated to optimize melting power so there is less wasted material and no wasted time.

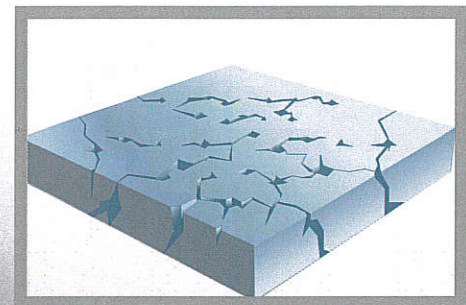

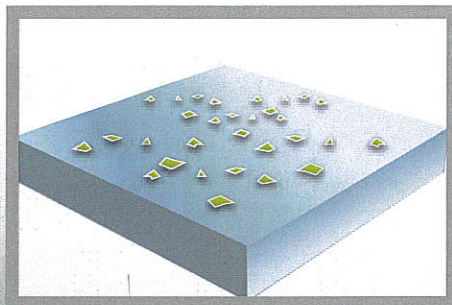

Granules that are too small will start melting quickly, but won't penetrate the ice layer to break it apart.

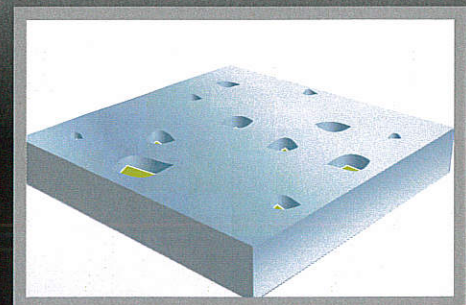

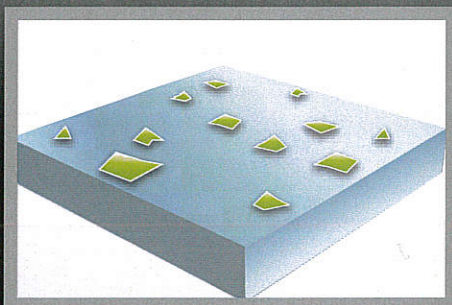

Granules that are too small won't penetrate the ice.

Large granules will often penetrate the ice layer, but won't dissolve efficiently to create a brine layer.

The consistent, medium-sized granules that are used in Meltmore penetrate the ice surface and maximize ice separation, making the removal process as easy as possible.

Meltmore uses consistent granules that optimize melting ability.

Granules that are too large won't dissolve properly.
